

Are you aware of the serious risks for RSV?

All babies are at risk of serious RSV (Respiratory syncytial virus) lung infection, which can include **bronchiolitis and pneumonia**, even those born over the summer.

RSV is **unpredictable**. It's difficult to know which babies will develop a **more serious illness** and need **medical attention**.

RSV can spread easily

More than half of all babies get RSV by age 1.

RSV is a leading cause of hospitalization in babies under 1.

What are the symptoms of RSV?

RSV often looks like a common cold at first, with sneezing, a runny nose, cough, and fever.

As the **infection** spreads to the lungs, **symptoms can worsen** and can include:

Short, shallow, and unusually fast breathing

Wheezing cough

Nasal flaring

Poor feeding

Help safeguard your baby against serious RSV infection. Consult your doctor today about an RSV preventive option.
